

ABSTRACT OF THE DISCLOSURE

In a cup-type beverage vending machine according to the present invention, during conveyance of a beverage-filled cup to a product taking-out position and when the cup does not reach the product taking-out position, a pivot arm is supported by a support roller and a cup on a cup stage is held by a holder. When the cup reaches the product taking-out position, a lower edge of the pivot arm is released from the support roller and the pivot arm and the holder are pivoted downward. Consequently, the holder is spaced downward apart from a front surface of the cup, which allows a customer to easily take out the cup.
